The combination of nivolumab (Opdivo®) and ipilimumab (Yervoy®) is approved for use in patients with intermediate or poor risk, previously untreated advanced renal cell carcinoma (RCC). Nivolumab and ipilimumab each improve anticancer responses and patient survival by inhibiting molecules known as checkpoints to enhance the patient’s immune response to melanoma. Nivolumab inhibits the checkpoint known as programmed death receptor-1 (PD-1), and ipilimumab inhibits the checkpoint cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4).

Antitumor activity is improved with nivolumab/ipilimumab combination therapy as compared with either monotherapy, but the risk and severity of immune-related adverse events (irAEs) is also heightened.

This document is part of an overall HCP toolkit intended to assist providers in optimizing management of advanced RCC in patients receiving newer immunotherapy drugs.
DRUG DOSAGE/ADMINISTRATION

- Obtain pretreatment laboratory tests (eg, adrenal function [ACTH], clinical chemistries, liver function tests, and thyroid function tests) prior to initiation of therapy. Clinical chemistries and liver function tests should be done before each cycle. Thyroid function tests should be done before Cycle 3 treatment, and every 6-12 weeks during nivolumab monotherapy.

- Both nivolumab and ipilimumab are monoclonal antibodies administered via intravenous infusion, using separate intravenous lines.

- Both nivolumab and ipilimumab are clear to opalescent, colorless to pale-yellow solutions. Their vials should be discarded if the solutions are cloudy, discolored, or contains extraneous particulate matter (other than a few translucent-to-white, proteinaceous particles).

- Neither ipilimumab nor nivolumab should be coadministered with each other or with other drugs through the same intravenous line.

- When administered in combination with each other, nivolumab should be infused first, followed on the same day by ipilimumab, using separate infusion bags and in-line filters with pore sizes of 0.2 – 1.2 microns for each infusion.

- Vials of nivolumab and ipilimumab should not be shaken.

- The dosing schema for the induction and maintenance phases is shown below.

### Nivolumab + Ipilimumab RCC Regimen Dosing Schedule

**Induction Phase (Both Agents Weight Based)**

<table>
<thead>
<tr>
<th>Weeks</th>
<th>Nivolumab (IV infusion over 30 minutes)</th>
<th>Ipilimumab (IV infusion over 30 minutes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>3 mg/kg</td>
<td>1 mg/kg</td>
</tr>
<tr>
<td>3</td>
<td>3 mg/kg</td>
<td>1 mg/kg</td>
</tr>
<tr>
<td>6</td>
<td>3 mg/kg</td>
<td>1 mg/kg</td>
</tr>
<tr>
<td>9</td>
<td>3 mg/kg</td>
<td>1 mg/kg</td>
</tr>
</tbody>
</table>

**Maintenance Phase (Nivolumab, Flat Dose)**

- Nivolumab 240 mg every 2 weeks or 480 mg every 4 weeks

Total of 4 cycles of nivolumab followed by ipilimumab (every 3 weeks)

*Note: Cycle 4 is not specified in the dose schedule.*
Because nivolumab and ipilimumab are immunotherapies that work by enhancing the patient’s immune system, most adverse reactions associated with the combination are related to overactivity of the patient’s immune system (ie, immune-related adverse events [irAEs]). Various organ systems or tissues may be affected. Risk and severity of irAEs are relatively higher when nivolumab and ipilimumab are coadministered than when used as monotherapies. The irAEs associated with nivolumab/ipilimumab combination therapy also tend to have an earlier onset.

 Keys to toxicity management:

- Proactive assessment for early signs/symptoms of toxicity
- Prompt intervention
- irAEs are typically managed with does interruption and selective use of corticosteroids
- In rare instances, toxicity may be steroid refractory, and additional immunosuppressive agents may be necessary (infliximab, mycophenolate mofetil, cyclophosphamide, etc)
- Nivolumab/ipilimumab may be held or discontinued depending on severity and/or persistence of the irAE
- Referral to organ specialist should be considered

irAEs associated with nivolumab/ipilimumab combination therapy can be categorized as most common, less common but serious, and others that are easily overlooked

Table 1 lists these irAEs and the corresponding Care Step Pathways in Appendix 1. Other adverse events associated with nivolumab/ipilimumab are shown in Appendix 2.
**CLINICAL PEARLS**

- Nivolumab/ipilimumab-related irAEs may occur at any time, including after treatment completion or discontinuation. Continuing to monitor patients is critical.

- It is important to monitor laboratory values at the start of treatment, periodically during treatment, and as indicated clinically. Laboratory values commonly monitored include: CBC w/differential, creatinine, alkaline phosphatase, AST/ALT, bilirubin (direct/total), sodium, potassium, calcium, magnesium, thyroid function, and glucose. Please see individual irAE CSPs for more specific discussion of laboratory monitoring.

- Patients sometimes experience signs/symptoms that they think are due to “flu” or a cold, but that actually represent an irAE or an infusion reaction.

- Endocrinopathies often present with vague symptoms (fatigue, headache, and/or depression) that can easily be overlooked or initially misdiagnosed. Hypervigilance and follow-up is important on the part of both HCPs and patients.

- Unlike other irAEs, endocrinopathies usually do not resolve and may require lifelong hormone replacement therapy.

- IrAEs may become apparent upon tapering of corticosteroids, since they can be suppressed or masked by immunosuppressive therapy. Patients should be advised to be on the lookout for early signs of irAEs during the tapering period.

- HCPs should encourage patients to carry information about their nivolumab/ipilimumab regimen with them at all times. This might be the Immunotherapy Wallet Card from the Oncology Nursing Society, the nivolumab- and ipilimumab-specific wallet cards, or at least emergency phone numbers and the side effects associated with the regimen. You may suggest they paperclip the wallet and insurance cards together so information about their regimen will be shared whenever they show the insurance card.

- Advise patients to take pictures of any skin lesions for documentation.
Q. After a well-tolerated induction with combination nivolumab/ipilimumab, a patient does well and has a significant response. The patient also does well on maintenance for a year, with stable disease, but then the disease begins to progress. Can the patient be reinduced with nivolumab/ipilimumab?

A. There are no data available regarding ‘reinduction’ treatment with ipilimumab and nivolumab in advanced renal cell carcinoma.

Q. Should an asymptomatic endocrinopathy be treated?

A. A transient period of asymptomatic hyperthyroidism can sometimes be observed with PD-1 monotherapy, but it is more commonly observed early in treatment with combination nivolumab/ipilimumab. In the Checkmate 214 phase 3 trial, 16% of patients treated with the combination experienced hypothyroidism of any grade (Motzer RJ et al. N Engl J Med. 2018; 378:1277-1290.)

This period is typically followed by hypothyroidism which can be clinically detectable and often requires permanent hormone replacement therapy.

Q. If a patient does not finish all 4 doses of induction, can they go on to receive maintenance nivolumab?

A. This decision is made on an individual basis. Some safety factors taken into consideration are: (1) the severity of immune related side effects; (2) the time it took for the side effects to resolve; and (3) the specific side effects that contributed to the truncation of induction. Oftentimes, patients have been able to successfully transition to maintenance nivolumab.

APPENDIX 2
### Management of other AEs associated with nivolumab/ipilimumab therapy.

<table>
<thead>
<tr>
<th>Adverse event</th>
<th>Common symptoms</th>
<th>Common management/anticipatory guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acute respiratory distress syndrome</td>
<td>Severe shortness of breath, dyspnea, or rapid breathing, hypotension, confusion, and extreme fatigue</td>
<td>* Serious condition requiring hospitalization/expert care, including supplemental oxygen, often mechanical ventilation, and fluid management</td>
</tr>
</tbody>
</table>
| Anorexia                                            | Decreased appetite                                                            | * Monitor weight; query patient about appetite/eating habits; advise dietary modification if necessary. (should improve with time)  
* Anticipate standard dose holds/discontinuations*  
* Consider referral to nutrition services for counseling on best food choices to avoid excessive weight loss |
| Cardiotoxicity: cardiomyopathy, myocarditis, heart failure | Dyspnea, edema, fatigue, chest pain, arrhythmias, abdominal pain or ascites   | * Monitor weight, changes in breathing, extremity edema, chest/back/arm/jaw pain, pressure  
* ECG, Echo, stress test cardiology referral, 2 mg/kg prednisone, discontinue therapy |
| Constipation/abdominal pain (associated with nivolumab) | Infrequent stools/difficulty stooling, abdominal pain                        | * Increase fluid, fiber; use caution with use of laxatives  
* Consider appropriate testing to evaluate bowel obstruction  
* Anticipate standard nivolumab dose holds/discontinuations* for Grade 3 and Grade 4 (constipation with manual evacuation indicated, severe abdominal pain, or life-threatening consequences) |
| Embryo-fetal toxicity                               | —                                                                              | * Advise of risk to fetus and recommend use of effective contraception during treatment and for 3 months after ipilimumab and for 5 months after nivolumab is discontinued  
* Advise patient to tell HCP immediately if they or their partner suspect they are pregnant while taking therapy |
| Encephalitis                                        | Headache, fever, tiredness, confusion, memory problems, sleepiness, hallucinations, seizures, stiff neck | * New-onset (Grade 2-3) moderate to severe symptoms: rule out infectious or other causes; consult neurologist, obtain brain MRI and lumbar puncture  
* For ipilimumab: Anticipate standard ipilimumab dosage holds/discontinuations;* administer corticosteroids at dose of 1-2 mg/kg/d prednisone equivalents (or 2-4 mg/kg if necessary)  
* For nivolumab: Withhold nivolumab for new-onset moderate to severe neurologic symptoms; evaluate as described above; if other etiologies are ruled out, administer corticosteroids and permanently discontinue nivolumab for immune-mediated encephalitis |

</table>
| Fatigue                                   | Feeling tired; lack of energy                         | • Query patients regarding energy level; evaluate possible contributory factors, including infection, disease progression, and hematological and metabolic abnormalities; standard supportive care  
• Anticipate standard dose holds/discontinuations*  
• Fatigue that interferes with ADLs is concerning and should be evaluated for underlying causes, such as possible endocrinopathy |
| Headache                                  | Head pain                                            | • Need to rule out brain metastases, encephalitis, or hypophysitis; otherwise, standard supportive care (should improve with time)  
• Headache occurring in conjunction with fatigue could be indicative of hypophysitis  
• Anticipate standard dose holds/discontinuations* |
| Infusion reaction                         | Chills/shaking, back pain, itching, flushing, difficulty breathing, hypotension, fever | • Nivolumab and/or ipilimumab: For mild/moderate (Grade 1-2) reactions: interrupt or slow rate of infusion; monitor to recovery  
• For severe/life-threatening (Grade 3-4) reactions: Discontinue nivolumab and/or ipilimumab; manage anaphylaxis via institutional protocol; monitor. Premedication with an antipyretic and antihistamine may be considered for future doses |
| Insomnia (associated with ipilimumab and corticosteroid therapy) | Difficulty falling or staying asleep                  | • Counsel patients on good sleep habits; prescription medications can be used if needed (should improve over time)  
• Anticipate standard dose holds/discontinuations* |
| Nausea/vomiting                           | Vomiting, queasiness, RUQ or LUQ pain                 | • Provide standard supportive care, since it is adequate in most cases  
• Check LFTs/lipase/amylase if hepatotoxicity or pancreatitis is suspected  
• Anticipate standard dose holds/discontinuations |
| Ocular: conjunctivitis, blepharitis, episcleritis, iritis, ocular myositis, scleritis, uveitis (associated with ipilimumab) | Blurry vision, double vision, or other vision problems, eye pain or redness | • Test and evaluate for uveitis and episcleritis (by ophthalmologist, preferably)  
• Urgency of ophthalmology referral increases with grade  
• G1: continue immunotherapy, use artificial tears  
• G2: hold immunotherapy; ophthalmic and systemic CS (under ophthalmologist guidance)  
• G3 or G4: permanently discontinue immunotherapy; treatment by ophthalmologist to include ophthalmic and systemic CS |
### Management of other AEs associated with nivolumab/ipilimumab therapy.

**Dose holds/discontinuations**

*For nivolumab: Withhold for any Grade 3 (severe) AE. Permanently discontinue for any Grade 4 (life-threatening) AE, persistent Grade 2-3 AE, any severe (Grade 3) AE that recurs, or when ≥10 mg/d prednisone or equivalent is required for 12 weeks. Resume treatment when AE returns to Grade 0 or 1.

For ipilimumab: Withhold for any Grade 2 (moderate) AE, and resume treatment when AE returns to Grade 0 or 1; permanently discontinue for any Grade 3-4 (life-threatening) AE, persistent Grade 2 AE lasting ≥6 weeks, or inability to reduce corticosteroid dosage to 7.5 mg/d prednisone or equivalent.
